Polysomnography in Children: 2006 Update

TK Wong

Abstract

Polysomnography is the standard investigation for diagnosing obstructive sleep apnoea syndrome and a wide range of sleep problems in children. The initial standards were published more than 10 years ago. Over the past decade, technology evolved rapidly. New clinical data were published. This update outlines the current standard, important changes, unanswered questions, and the future direction of development of polysomnography in children.
